

Estimation Methodology for RACs in the 2006 IPCC Guidelines and 2019 Refinement

The 17th Workshop on GHG Inventories in Asia (WGIA17)
30 July - 2 August 2019, Singapore

Kiyoto Tanabe
Co-Chair, IPCC TFI

Guidance in the 2006 IPCC Guidelines

Refrigeration and Air Conditioning (RAC)

- One of the major application areas of ODS substitutes
- May be classified into 6 sub-application domains or categories:
 - i. Domestic (i.e., household) refrigeration;
 - ii. Commercial refrigeration including different types of equipment, from vending machines to centralised refrigeration systems in supermarkets;
 - iii. Industrial processes including chillers, cold storage, and industrial heat pumps used in the food, petrochemical and other industries;
 - iv. Transport refrigeration including equipment and systems used in refrigerated trucks, containers, reefers, and wagons;
 - v. Stationary air conditioning including air-to-air systems, heat pumps, and chillers for building and residential applications; and
 - vi. Mobile air-conditioning systems used in passenger cars, truck cabins, buses, and trains

F-gases used as refrigerant in RAC

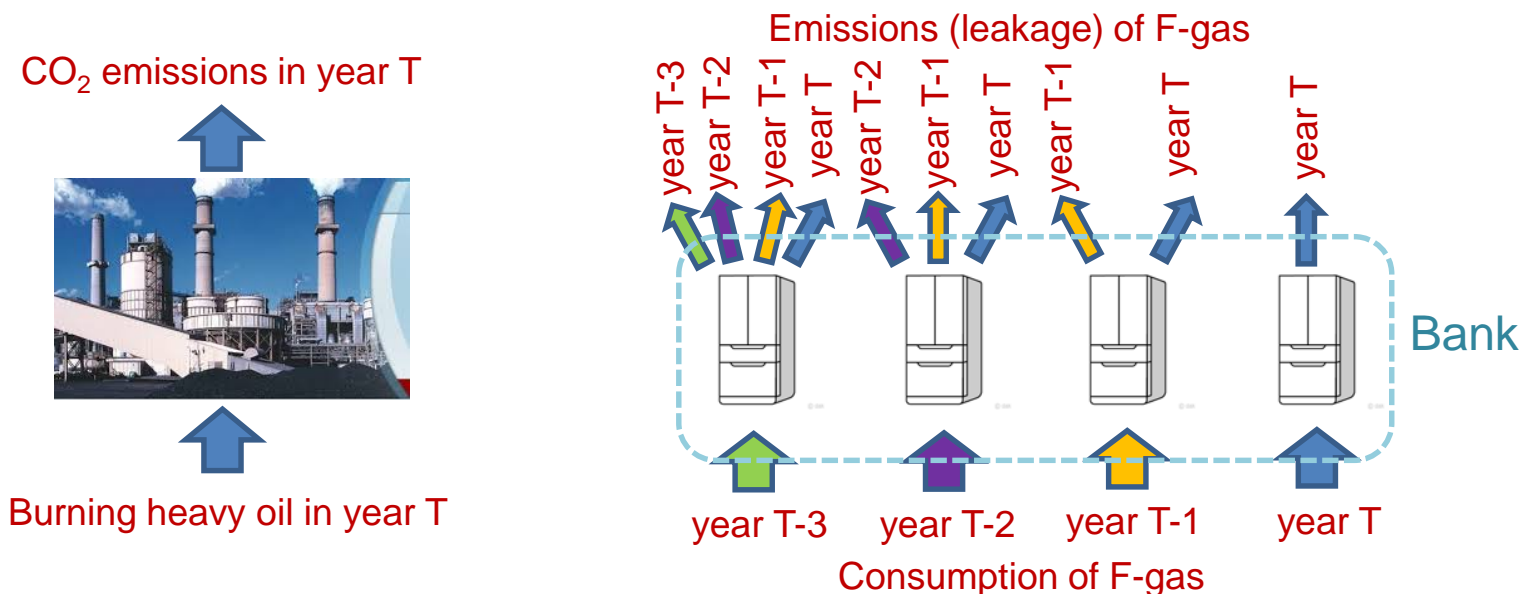

- A large number of blends containing HFCs and/or PFCs are being used.
- The most common of these blends are shown in Table 7.8 in Chapter 7, Vol.3 of 2006 IPCC Guidelines.

TABLE 7.8
BLENDS (MANY CONTAINING HFCs AND/OR PFCs)

| Blend | Constituents | Composition (%) |
|--------|--------------------------------------|----------------------------------|
| R-400 | CFC-12/CFC-114 | Should be specified ¹ |
| R-401A | HCFC-22/HFC-152a/HCFC-124 | (53.0/13.0/34.0) |
| R-401B | HCFC-22/HFC-152a/HCFC-124 | (61.0/11.0/28.0) |
| R-401C | HCFC-22/HFC-152a/HCFC-124 | (33.0/15.0/52.0) |
| R-402A | HFC-125/HC-290/HCFC-22 | (60.0/2.0/38.0) |
| R-402B | HFC-125/HC-290/HCFC-22 | (38.0/2.0/60.0) |
| R-403A | HC-290/HCFC-22/PFC-218 | (5.0/75.0/20.0) |
| R-403B | HC-290/HCFC-22/PFC-218 | (5.0/56.0/39.0) |
| R-404A | HFC-125/HFC-143a/HFC-134a | (44.0/52.0/4.0) |
| R-405A | HCFC-22/ HFC-152a/ HCFC-142b/PFC-318 | (45.0/7.0/5.5/42.5) |

Difficulty in estimating emissions

- Considerable time lag between consumption and emission
 - A chemical placed in new products slowly leaks out over many years.

- Hurdles for collecting necessary data/information
 - Cooperation is required of various players including private companies.
 - Care needs to be taken in dealing with refrigerant blends.
 - Trade of equipment needs to be monitored.

“Bank”

Total amount of substances contained in existing equipment not yet released to the atmosphere

$$Bank_y = Bank_{y-1} + Addition_y - Removal_y$$

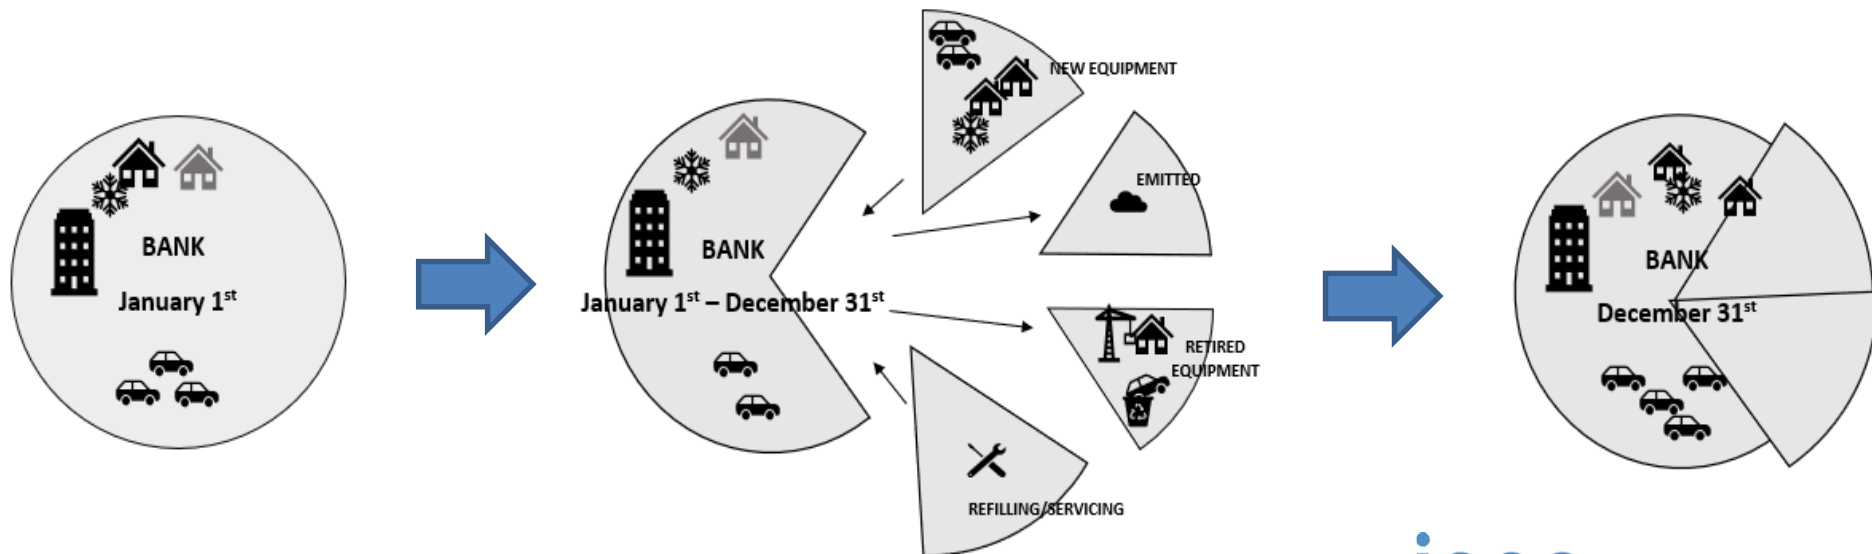

Where:

$Bank_y$ = Refrigerant bank on December 31st of year y, kg

$Bank_{y-1}$ = Refrigerant bank on December 31st of year y-1/January 1st of year y, kg

$Addition_y$ = Addition of new substances year y, kg

$Removal_y$ = Removal of substances exported, emitted or destroyed year y, kg

Methods to estimate emissions

- Three methods are provided in the *2006 IPCC Guidelines*.
 - Tier 1: Use of spreadsheet calculation tool
 - Tier 2a: Emission factor approach
 - Tier 2b: Mass balance approach
- Which tier should be used?
 - Follow the decision tree in Figure 7.6 in Chapter 7, Vol. 3
- If RAC is a *key category*, either Tier 2a or 2b should be used.
- Even if RAC is not a *key category*, inventory compilers may conclude Tier 2 provides more value with little extra work as compared to Tier 1.

Tier 1 – spreadsheet calc tool

- Tier 1 method can be used if you have at least the data/information on:
 - Year of introduction of the refrigerant
 - Domestic production of the refrigerant in the current year
 - Imports of the refrigerant in the current year
 - Exports of the refrigerant in current year
 - Growth rate of sales of equipment that uses the refrigerant

- Empirical assumptions are used to fill in the data gaps to enable estimation of emissions.

- However, it is still necessary to have an accurate assessment of net consumption activity data.

Tier 1 – spreadsheet calc tool

Available as an MS-Excel file from the IPCC TFI website.

Tier 2a – Emission Factor Approach

- Emissions are calculated separately for four stages:
- $E_{\text{containers},t}$ = emissions related to the management of refrigerant containers
 - $E_{\text{charge},t}$ = emissions related to the refrigerant charge: connection and disconnection of the refrigerant container and the new equipment to be charged
 - $E_{\text{lifetime},t}$ = annual emissions from the banks of refrigerants associated with the six sub-applications during operation (fugitive emissions and ruptures) and servicing
 - $E_{\text{end-of-life},t}$ = emissions at system disposal

EQUATION 7.10

SUMMARY OF SOURCES OF EMISSIONS

$$E_{\text{total},t} = E_{\text{containers},t} + E_{\text{Charge},t} + E_{\text{lifetime},t} + E_{\text{end-of-life},t}$$

Tier 2a – Emission Factor Approach

➤ Refrigerant management of containers

EQUATION 7.11

SOURCES OF EMISSIONS FROM MANAGEMENT OF CONTAINERS

$$E_{containers,t} = RM_t \cdot \frac{c}{100}$$

Where:

$E_{containers,t}$ = emissions from all HFC containers in year t , kg

RM_t = HFC market for new equipment and servicing of all refrigeration application in year t , kg

c = emission factor of HFC container management of the current refrigerant market, percent

➤ Refrigerant charge emissions of new equipment

EQUATION 7.12

SOURCES OF EMISSIONS WHEN CHARGING NEW EQUIPMENT

$$E_{charge,t} = M_t \cdot \frac{k}{100}$$

Where:

$E_{charge,t}$ = emissions during system manufacture/assembly in year t , kg

M_t = amount of HFC charged into new equipment in year t (per sub-application), kg

k = emission factor of assembly losses of the HFC charged into new equipment (per sub-application), percent

Note: the emissions related to the process of connecting and disconnecting during servicing are covered in Equation 7.13.

Tier 2a – Emission Factor Approach

➤ Emissions during lifetime (operation and servicing)

EQUATION 7.13
SOURCES OF EMISSIONS DURING EQUIPMENT LIFETIME

$$E_{lifetime, t} = B_t \cdot \frac{x}{100}$$

Where:

$E_{lifetime, t}$ = amount of HFC emitted during system operation in year t , kg

B_t = amount of HFC banked in existing systems in year t (per sub-application), kg

x = annual emission rate (i.e., emission factor) of HFC of each sub-application bank during operation, accounting for average annual leakage and average annual emissions during servicing, percent

➤ Emissions at end-of-life

EQUATION 7.14
EMISSIONS AT SYSTEM END-OF-LIFE

$$E_{end-of-life, t} = M_{t-d} \cdot \frac{p}{100} \cdot \left(1 - \frac{\eta_{rec, d}}{100}\right)$$

Where:

$E_{end-of-life, t}$ = amount of HFC emitted at system disposal in year t , kg

M_{t-d} = amount of HFC initially charged into new systems installed in year $(t-d)$, kg

p = residual charge of HFC in equipment being disposed of expressed in percentage of full charge, percent

$\eta_{rec, d}$ = recovery efficiency at disposal, which is the ratio of recovered HFC referred to the HFC contained in the system, percent

Tier 2a – Emission Factor Approach

➤ Default emission factors are provided in Table 7.9.

| TABLE 7.9 ESTIMATES ¹ FOR CHARGE, LIFETIME AND EMISSION FACTORS FOR REFRIGERATION AND AIR-CONDITIONING SYSTEMS | | | | | | |
|--|------------------------|--------------------------------|--|-----------------------|----------------------------------|--------------------------|
| Sub-application | Charge (kg) | Lifetimes (years) ² | Emission Factors (% of initial charge/year) ³ | | End-of-Life Emission (%) | |
| Factor in Equation | (M) | (d) | (k) | (x) | ($\eta_{rec,d}$) | (p) |
| | | | Initial Emission | Operation Emission | Recovery Efficiency ⁴ | Initial Charge Remaining |
| Domestic Refrigeration | $0.05 \leq M \leq 0.5$ | $12 \leq d \leq 20$ | $0.2 \leq k \leq 1$ | $0.1 \leq x \leq 0.5$ | $0 < \eta_{rec,d} < 70$ | $0 < p < 80$ |
| Stand-alone Commercial Applications | $0.2 \leq M \leq 6$ | $10 \leq d \leq 15$ | $0.5 \leq k \leq 3$ | $1 \leq x \leq 15$ | $0 < \eta_{rec,d} < 70$ | $0 < p < 80$ |
| Medium & Large Commercial Refrigeration | $50 \leq M \leq 2000$ | $7 \leq d \leq 15$ | $0.5 \leq k \leq 3$ | $10 \leq x \leq 35$ | $0 < \eta_{rec,d} < 70$ | $50 < p < 100$ |
| Transport Refrigeration | $3 \leq M \leq 8$ | $6 \leq d \leq 9$ | $0.2 \leq k \leq 1$ | $15 \leq x \leq 50$ | $0 < \eta_{rec,d} < 70$ | $0 < p < 50$ |
| Industrial Refrigeration | $10 < M < \dots$ | \dots | \dots | \dots | $0 < \eta_{rec,d} < \dots$ | $50 < p < \dots$ |

Tier 2b – Mass Balance Approach

EQUATION 7.9

DETERMINATION OF REFRIGERANT EMISSIONS BY MASS BALANCE

$$\begin{aligned} \text{Emissions} = & \text{Annual Sales of New Refrigerant} - \text{Total Charge of New Equipment} \\ & + \text{Original Total Charge of Retiring Equipment} - \text{Amount of Intentional Destruction} \end{aligned}$$

- Does not rely on emission factors.
- Relies on a knowledge of the annual sales of refrigerant, refrigerant destroyed and any changes in equipment stock that occur on a sub-application basis.
- May underestimate emissions when equipment stocks are growing, because there is a lag between the time the emissions occur and the time they are detected (through equipment servicing).

Refinements made in the 2019 Refinement

No change in methodology

- Methodological framework remains unchanged.
 - No refinement in the Tier 1 spreadsheet calculation tool.
 - No refinement in the Tier 2a equations.
 - No refinement in the Tier 2b equations.
 - No refinement in the decision tree.

More helpful guidance added

- “Cook-book” style guidance as regards:
 - How to implement Tier 1 and Tier 2a in a few simple steps
 - ✓ For Tier 2a, the spreadsheet “Calculation example for 2F1 (Tier 2)” is provided.
 - Basic elements of an HFC emission inventory for RAC
 - ✓ Explanation about the “bank” as well as the flow into and out of the bank
 - How to build the “bank”
- Information on common data sources
- Examples of national studies on emission rates for stationary RAC systems
